

Claude Code's Loop Skill

Your AI agent now works
while you're not watching.

Recurring tasks. Reminders. Monitoring.
All inside one session.

What is Loop?

A built-in Claude Code skill that
schedules recurring tasks for up to 3 days

Uses cron jobs under the hood

Works in Terminal, VS Code, and Desktop app

Invoke with `/loop` or just plain English

Two Modes of Loop

Recurring Intervals

Every 5 min: check deploy

Every 30 min: review logs

Every hour: run review-pr skill

Every 2 hours: check ClickUp

One-Time Reminders

At 3 PM: remind me to call

In 45 min: stand up and stretch

At 4:30: pick up groceries

At 10:23: check on project

Both use cron jobs. One-time reminders auto-delete after firing.

How to Use It

Just type naturally or use the /loop command:

```
Claude Code Terminal

1 # Using /loop command
2 > /loop 5m check if deploy is healthy
3
4 # Using natural language
5 > Every 10 minutes, check my ClickUp
6 for new updates on our project
7
8 # One-time reminder
9 > At 3 PM remind me to review the PR
10
11 # Loop a skill
```

Key Features

01

Same Session Context

Runs in your current session.
Reads previous context continuously.

02

Loop Any Skill

Chain with `/review-pr`, `/commit`,
or any custom skill on a timer.

03

Natural Language

No syntax to learn.
Just describe what you want.

04

Cancel Anytime

Just say 'stop the loop'
or 'cancel that reminder'.

How It Works Under the Hood

Loop vs Scheduled Tasks

Loop

- X 3-day expiry
- X Same session only
- X No catch-up
- X Available everywhere

When to

use which?

Scheduled Tasks

- ✓ Long-lived
- ✓ Persistent storage
- ✓ Has catch-up
- ✓ Desktop app only (for now)

6 Ways to Use Loop Today

1

1. Monitor urgent emails every 5 min

2

2. Check deploy status every hour

3

3. Track a 3-day sprint deadline

4

4. Watch logs during testing

5

5. Run review-pr on a schedule

6

6. Build your own executive assistant

Know the Limits

3-day max expiry, then auto-deletes

Close terminal = all loops gone

No catch-up if you miss a fire

Each tab has its own separate loops

For anything longer than 3 days

use Scheduled Tasks instead
